

## MODULE - 2

FFT Algorithms : use of DFT in linear filtering, Direct computation of DFT, need for efficient computation of the DFT (FFT algorithms). Radix-2 FFT algorithms for the computation of DFT and IDFT - decimation in-time and decimation-in-frequency algorithms.

### USE of DFT in linear filtering :-

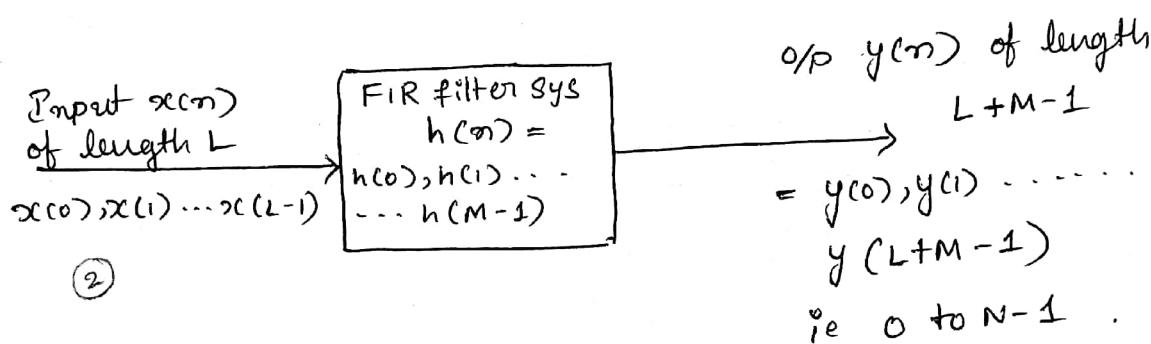

- \* The DFT provides a discrete frequency representation of a finite-duration sequence in the frequency domain.
  - ∵ DFT can be used as a computational tool for linear system analysis and especially for linear filtering.
- \* Because of continuous variable "ω", the computations cannot be done on a digital computer.
  - ∵ Computer can only store and perform computations on quantities at discrete frequencies.
  - ∵ DFT lends itself to computation on a digital computer.
  - DFT can be used to perform linear filtering in the frequency domain.
  - An alternative to time-domain convolution.
  - More efficient than time-domain convolution ∵ of efficient algorithms.

\* Linear filtering operation is implemented with the help of linear convolution.

\* The o/p  $y(n)$  is obtained by convolving impulse response  $h(n)$  with input  $x(n)$

→ Let the unit sample response of the LTI system be  $h(n)$  of length "M". i.e  
 $h(0), h(1) \dots h(M-1)$

→ i/p to the LTI system be  $x(n)$  of length "L"  
i.e  $x(0), x(1), x(2) \dots x(L-1)$

$$\therefore y(n) = \sum_{k=-\infty}^{\infty} h(k)x(n-k) \quad \rightarrow (1)$$

(3)

$y(n)$  o/p of LTI sys,  $y(n)$  is a linear convolution of  $h(n) \otimes x(n)$

→ Consider the Fourier transform of the Eq<sup>n</sup> (1)

$$Y(\omega) = F \left[ \sum_{k=-\infty}^{\infty} h(k)x(n-k) \right] \quad \rightarrow (2)$$

(4)

→ Wkt Convolution property of Fourier transform is

$$F \{ x_1(n) * x_2(n) \} = X_1(\omega)X_2(\omega)$$

$$\therefore Y(\omega) = H(\omega) \cdot X(\omega) \quad \rightarrow (3)$$

(5)

W k+

$y(k)$  can be obtained from  $y(\omega)$  as

$$Y(k) = Y(\omega) \Big|_{\omega = \frac{2\pi k}{N}}, \quad k=0,1,2 \dots N-1$$

$$\therefore Y(k) = X(\omega) \cdot H(\omega) \Big|_{\omega = \frac{2\pi k}{N}}, \quad k=0,1,2 \dots N-1$$

Since  $X(\omega) \Big|_{\omega = \frac{2\pi k}{N}} = X(k)$

$$H(\omega) \Big|_{\omega = \frac{2\pi k}{N}} = H(k)$$

$$\therefore \textcircled{b} \quad Y(k) = X(k) \cdot H(k) \quad k=0,1,2 \dots N-1$$

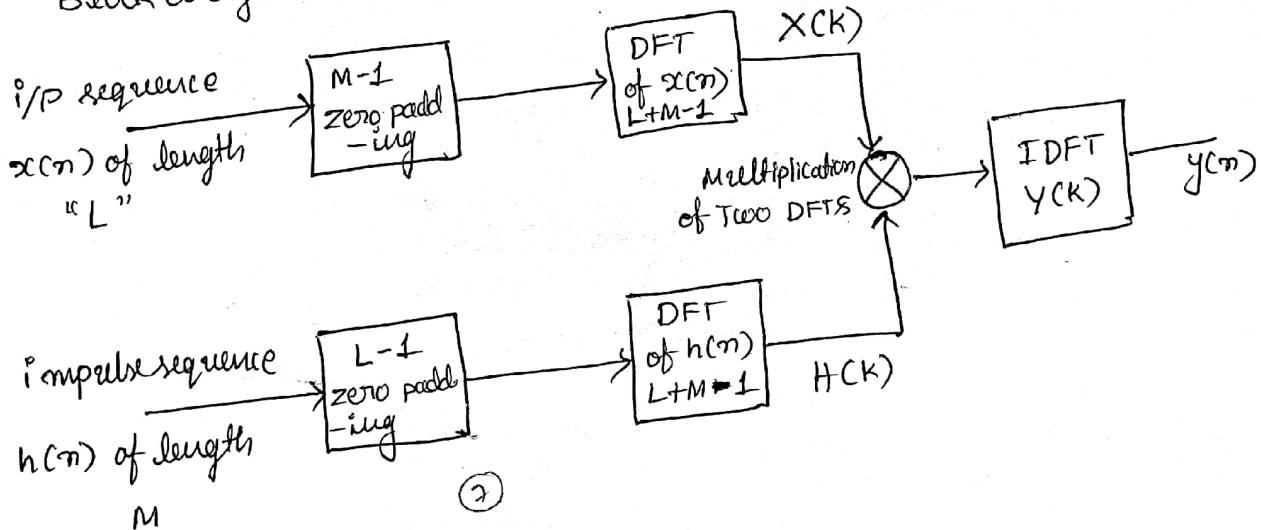

\* Multiplying "N" point DFT of  $x(n)$  &  $h(n)$ , we get DFT of  $y(n)$ . This DFT represent  $y(n)$  uniquely if  $N \geq L+M-1$ . Hence  $y(n)$  can be obtained by taking IDFT of  $Y(k)$ .

$$y(n) = \text{IDFT} \{ Y(k) \}$$

$$= \text{IDFT} \{ X(k) \cdot H(k) \}$$

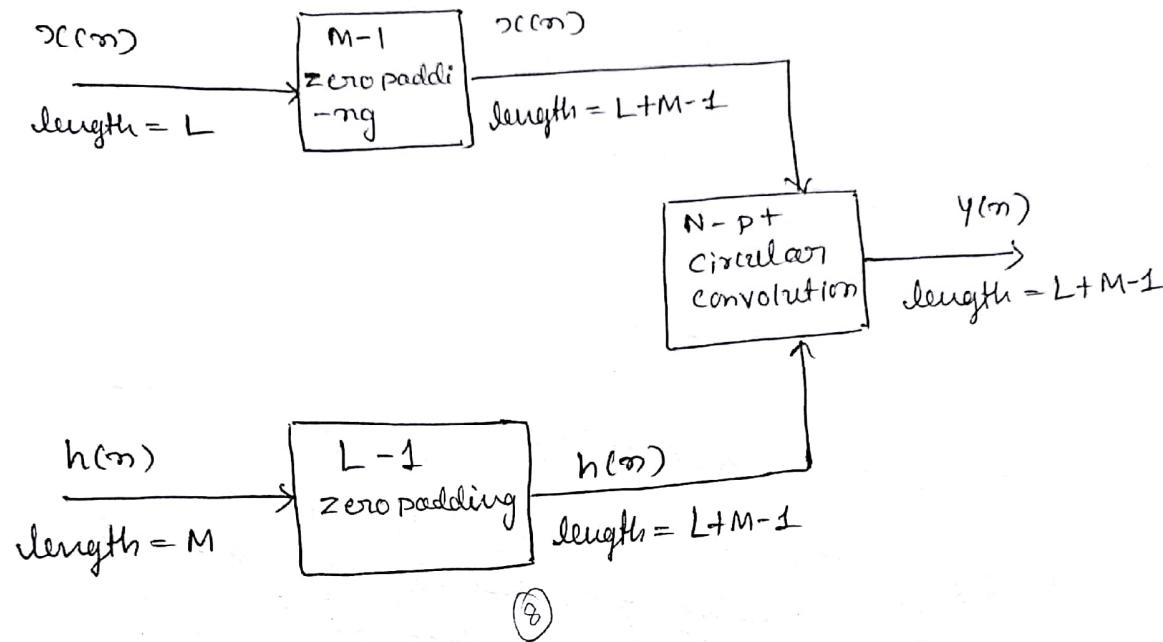

\* Linear convolution can be implemented using DFT.

Block diagram representation by block diagram.

\* Linear convolution implemented by circular convolution

$$y(n) = x(n) \circledast_N h(n) \Rightarrow x(k) \cdot h(k)$$

### Direct Computation of DFT :

#### (a) Computational complexity of DFT

By def<sup>n</sup> DFT is given by

$$X(k) = \sum_{n=0}^{N-1} x(n) w_N^{kn}, \quad k = 0, 1, \dots, N-1$$

where  $x(n) \rightarrow$  i/p sequence which can be real (Q7)  
complex

$w_N \rightarrow$  is twiddle factor which is complex  
(Also known as phase factor)

$\therefore$  computation of  $X(k)$  involves the multiplication and summation of complex numbers.

$$X(k) = x(0) w_N^0 + x(1) w_N^{1k} + \dots + x(N-1) w_N^{(N-1)k}$$

$\rightarrow (N-1)$  complex addition for one value of  $k$

$\rightarrow (N)$  complex multiplications for one value of  $k$

$\rightarrow$  No. of complex multiplications required for calculating  $X(k)$  for  $k = 0, 1, 2, \dots, N-1 \Rightarrow \underline{N \times N = N^2}$

$\rightarrow$  No. of complex additions required for calculating  $X(k)$  for  $k = 0, 1, 2, \dots, N-1 \Rightarrow \underline{(N-1)N = N^2 - N}$

Ex: If we want to evaluate 1024 point DFT  $N = 1024$

$$(i) \text{ complex multiplications} = N^2 = (1024)^2 = 1 \times 10^6$$

$$(ii) \text{ Addition} = N(N-1) = 1024 \times 1024 \\ = \underline{1 \times 10^6}$$

(b) Need for efficient computation of DFT :

Let us assume that processor executes one complex multiplication and one complex addition in 1 micro second.

If  $N = 1024$  then time taken will be

$$t = (1024 \times 10^{-6} + 1024 \times 10^{-6}) = 2 \text{ seconds}$$

→ This 2 seconds is large time & hence there is a need for efficient computation of DFT

Time =  $\left[ (\text{complex multiplication}) \times (\text{Time for one multiplication}) \right]$   
 $+ (\text{complex addition} \times \text{Time for one addition})$

Properties of phase Factor ( $w_N$ ) :

"N"- pt DFT of sequence  $x(n)$  is given as

$$X(k) = \sum_{n=0}^{N-1} x(n) w_N^{kn} \quad k=0, 1, 2, \dots, N-1$$

where  $w_N \rightarrow$  twiddle factor or phase factor

$$\text{or } w_N = e^{-j\frac{2\pi}{N}}$$

→ This twiddle factor exhibits symmetry and periodicity properties.

(i) Periodicity property of  $w_N$  :

$$w_N^{k+N} = w_N^k$$

Proof :  $w_N^{k+N} = e^{-j\frac{2\pi}{N}(k+N)}$

$$w_N^{k+N} = e^{-j\frac{2\pi}{N}k - j\frac{2\pi}{N}N}$$

$$= e^{-j \frac{2\pi k}{N}} e^{-j \frac{2\pi (N-k)}{N} \times 1}$$

$$= e^{-j \frac{2\pi k}{N}}$$

$$= \left[ e^{-j \frac{2\pi}{N}} \right]^k = w_N^k$$

i.e.  $w_N^k$  is periodic with period "N"

$$w_N^{k+8} = w_N^k.$$

(ii) Symmetry Property :-

$$\boxed{w_N^{k+N/2} = -w_N^k} \quad \text{&} \quad \boxed{w_N^2 = w_{N/2}}$$

Proof : wkt  $w_N = e^{-j \frac{2\pi}{N} k}$

$$w_N^{k+N/2} = e^{-j \frac{2\pi}{N} [k+N/2]}$$

$$= e^{-j \frac{2\pi}{N} k} e^{-j \frac{2\pi}{N} \frac{N}{2}}$$

$$= e^{-j \frac{2\pi}{N} k} (-1)$$

$$= -e^{-j \frac{2\pi}{N} k}$$

$$\underline{\underline{w_N^{k+N/2} = -w_N^k}}$$

$$w_N = e^{-j \frac{2\pi}{N} k}$$

Replace N by  $N/2$

$$w_{N/2} = e^{-j \frac{2\pi}{N} \times 2}$$

$$\underline{\underline{w_{N/2} = w_N^2}}$$

\* The Direct computation of DFT does not use these properties of  $w_N$ . Then FFT algorithms use these properties of  $w_N$  to reduce calculation of DFT

## FFT Algorithms and their calculations & classification :-

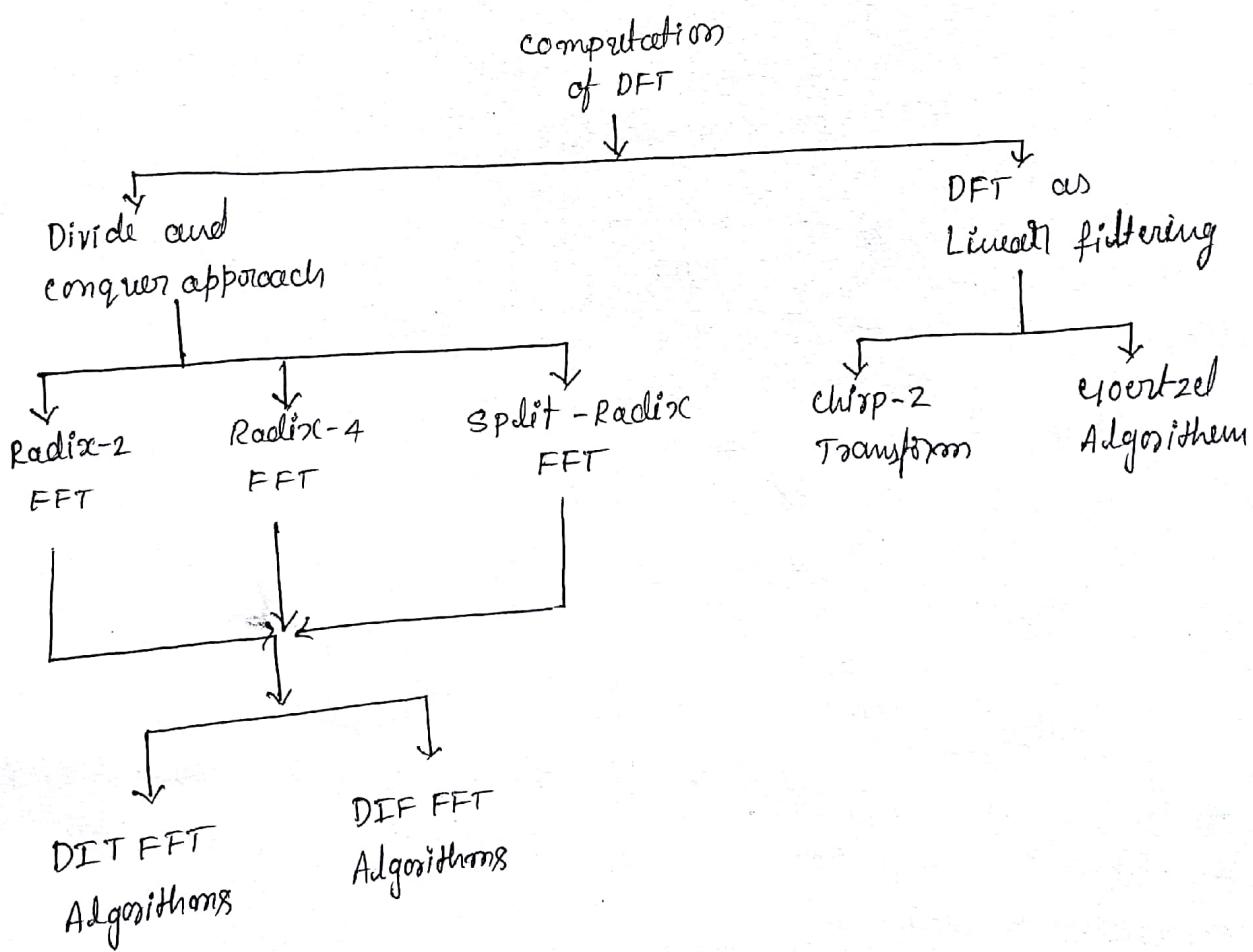

- \* FFT = Fast Fourier transform
- \* efficient computation of the DFT (FFT algorithms)
- \* uses the properties of twiddle factor for efficient computation of DFT.
- \* FFT algorithms are based on two basic methods .

### (1) Divide and conquer approach

- N-point DFT is divided successively to 2-point DFT's to reduce calculations
- Radix-2, Radix-4 decimation in time , decimation in frequency are developed.

### (2) Based on linear filtering

- There are two algorithms
  - (i) Goertzel algorithm
  - (ii) Chirp-z transform algorithm .

## \* Advantages of FFT Algorithms :-

(5)

- (1) can be used to compute DFT as well as IDFT very efficiently
- (2) computation complexity is greatly reduced compared to direct computation.
- (3) As the length of DFT increases, then computation time reduces.  
 $L \uparrow T \downarrow$
- (4) storage requirement of FFT is " $\frac{N}{2}$ " which is very small
- (5) real time implementation is possible only because of FFT algorithm.

## FFT Algorithms :-

\* In the direct computation of  $N$ -point DFT, number of complex multiplications and additions required are  $N^2$  and  $N(N-1)$  respectively.

\* The no. of complex multiplications can be reduced if the periodicity and symmetric property of phase factor are utilized

$$(i) \text{ Periodicity property } w_N^{k+N} = w_N^k \checkmark$$

$$(ii) \text{ Symmetry property } w_N^{k+N_2} = -w_N^k \checkmark$$

\* There are different ways of computing FFTs one of the most efficient method is the "Radix-2 FFT" algorithms.

Based on the divide-and-conquer approach.

→ In this method there are two ways of computing the FFT

(1) Decimation in time FFT Algorithm (DIT-FFT)

(2) Decimation in frequency FFT Algorithm (DIF-FFT)

\* To apply the Radix-2 FFT Algorithm number of the sample points in the i/p sequence must be  $N = 2^v$  where  $v \rightarrow$  is an integer.

### (1) Radix - 2 DIT-FFT Algorithm

Consider a sequence  $x(n)$  of length "N",  $N = 2^v$

→ The i/p sequence is divided into 2 sequence  $f_1(n)$  and  $f_2(n)$  each of length  $N/2$  where  $f_1(n)$  and  $f_2(n)$  consists of even and odd samples of  $x(n)$  respectively.

$$\begin{aligned} f_1(n) &= x_1(2n) \\ f_2(n) &= x_2(2n+1) \end{aligned} \quad \left. \right\} \quad 0 \leq n \leq \frac{N}{2} - 1$$

$$\text{By defn } X(k) = \text{DFT}[x(n)] = \sum_{n=0}^{N-1} x(n) w_N^{kn} \quad 0 \leq k \leq N-1$$

$$X(k) = \sum_{n(\text{even})} x(n) w_N^{kn} + \sum_{n(\text{odd})} x(n) w_N^{kn}$$

$$= \sum_{n=0}^{\frac{N}{2}-1} x(2n) w_N^{k2n} + \sum_{n=0}^{\frac{N}{2}-1} x(2n+1) w_N^{k(2n+1)}$$

$$= \sum_{n=0}^{\frac{N}{2}-1} f_1(n) w_{N/2}^{\frac{kkn}{2}} + \sum_{n=0}^{\frac{N}{2}-1} f_2(n) \cdot w_N^{\frac{k(2n+1)}{2}} w_N^k$$

$$= \sum_{n=0}^{\frac{N}{2}-1} f_1(n) \cdot w_{N/2}^{kn} + w_N^k \sum_{n=0}^{\frac{N}{2}-1} f_2(n) \cdot w_{N/2}^{kn}$$

$$X(k) = F_1(k) + w_N^k F_2(k) \quad 0 \leq k \leq N-1$$

$$X(k + \frac{N}{2}) = F_1(k + \frac{N}{2}) + w_N^{k + \frac{N}{2}} F_2(k + \frac{N}{2}) \quad 0 \leq k \leq \frac{N}{2} - 1$$

\*  $F_1(k)$  &  $F_2(k)$  are  $N/2$  point DFT and they are periodic with period  $N/2$

$$\therefore F_1(k+N/2) = F_1(k)$$

$$F_2(k+N/2) = F_2(k)$$

$$w_N^{k+N/2} = -w_N^k$$

$$\begin{aligned} w_N^{k+N/2} &= w_N^k \cdot w_N^{N/2} \\ &= w_N^k \cdot e^{-j\frac{2\pi}{N} \times \frac{N}{2}} \\ &= w_N^k \cdot (\cos \pi - j \sin \pi) \\ &= w_N^k (-1) = -w_N^k \end{aligned}$$

$$X(k) = F_1(k) + w_N^k F_2(k)$$

$$X(k+N/2) = F_1(k) - w_N^k F_2(k)$$

$$0 \leq k \leq \frac{N}{2} - 1$$

\* Direct computation of  $F_1(k)$  requires  $(N/2)^2$  complex multiplication

\*  $\underbrace{\quad}_{w_N^k} \underbrace{F_2(k)}_{w_N^k} \underbrace{\quad}_{F_1(k)}$   
Additional complex multiplications required to compute  $w_N^k F_2(k)$

\*  $\frac{N}{2}$  additional complex multiplications required to compute  $w_N^k F_2(k)$

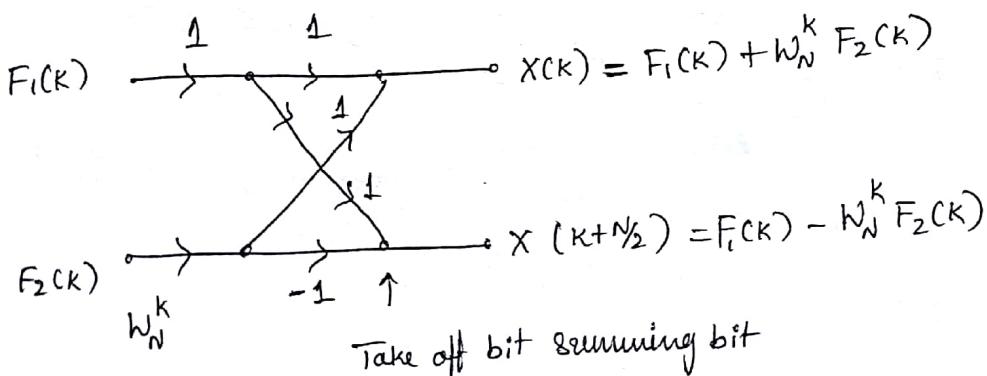

$$\begin{aligned} \therefore X(k) \text{ requires } & \Rightarrow \left(\frac{N}{2}\right)^2 + \left(\frac{N}{2}\right)^2 + \frac{N}{2} \\ &= 2 \left(\frac{N}{2}\right)^2 + \frac{N}{2} \text{ complex multiplication.} \end{aligned}$$

\* The no. of complex additions required to compute the  $N$ -point DFT is

$$\frac{N}{2} \left( \frac{N}{2} - 1 \right) + \frac{N}{2} \left( \frac{N}{2} - 1 \right) + N = \frac{N^2}{2}$$

$$= F_1(k) \quad F_2(k)$$

\* To compute  $X(k)$  from  $F_1(k)$  &  $F_2(k)$  "Butterfly diagram" is used

Ex: for  $N=8$

$$\begin{aligned} X(k) &= F_1(k) + w_8^k F_2(k) \\ X(k+4) &= F_2(k) - w_8^k F_1(k) \end{aligned} \quad \left. \begin{array}{l} \\ \end{array} \right\} 0 \leq k \leq 3$$

$$k=0, X(0) = F_1(0) + w_8^0 F_2(0)$$

$$X(4) = F_2(0) - w_8^0 F_1(0)$$

$$k=1, X(1) = F_1(1) + w_8^1 F_2(1)$$

$$X(5) = F_2(1) - w_8^1 F_1(1)$$

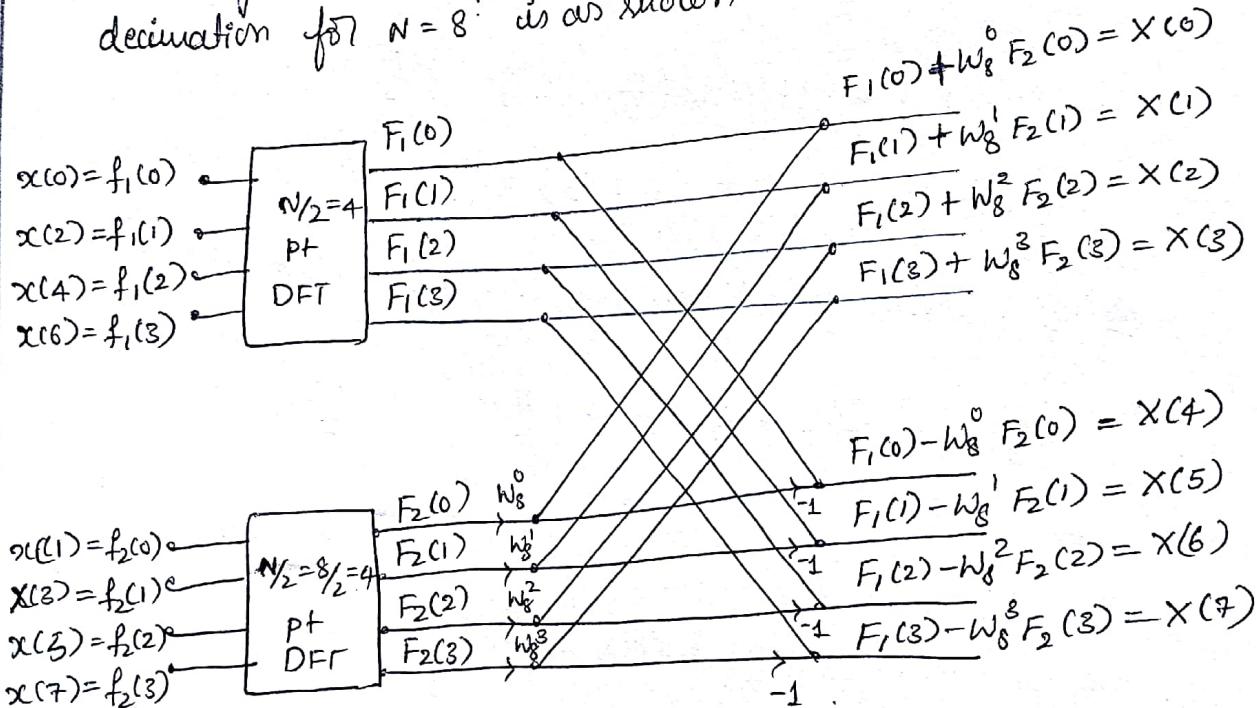

$$k=2, X(2) = F_1(2) + w_8^2 F_2(2)$$

$$X(6) = F_2(2) - w_8^2 F_1(2)$$

$$k=3, X(3) = F_1(3) + w_8^3 F_2(3)$$

$$X(7) = F_2(3) - w_8^3 F_1(3)$$

→ The signal flow graph / flow diagram at the end of first decimation for  $N=8$  is as shown below.

$$w_8^{k+1} F_1(k) = \sum_{m=0}^{N-1} f_1(m) w_{N/2}^{km}, \quad 0 \leq k \leq N/2 - 1$$

→  $f_1(n)$  is split into two sequences  $g_1(n)$  &  $g_2(n)$  consisting of even and odd samples of  $f_1(n)$  respectively.

$$g_1(n) = f_1(2n) \quad \& \quad g_2(n) = f_1(2n+1) \quad 0 \leq n \leq \frac{N}{2} - 1$$

$$\therefore F_1(k) = \sum_{n(\text{even})} f_1(n) W_{N/2}^{kn} + \sum_{n(\text{odd})} f_1(n) W_{N/2}^{kn}$$

$$= \sum_{n=0}^{\frac{N}{4}-1} f_1(2n) W_{N/2}^{kn} + \sum_{n=0}^{\frac{N}{4}-1} f_1(2n+1) W_{N/2}^{k(2n+1)}$$

$$F_1(k) = \sum_{n=0}^{\frac{N}{4}-1} g_1(n) W_{N/4}^{kn} + \sum_{n=0}^{\frac{N}{4}-1} g_2(n) W_{N/4}^{kn} W_{N/2}^k$$

$$= \sum_{n=0}^{\frac{N}{4}-1} g_1(n) W_{N/2}^{kn} + W_{N/2}^k \sum_{n=0}^{\frac{N}{4}-1} g_2(n) W_{N/4}^{kn}$$

$$F_1(k) = e_1(k) + W_{N/2}^k e_2(k), \quad 0 \leq k \leq \frac{N}{4} - 1$$

$e_1(k)$  &  $e_2(k)$  are  $\frac{N}{4}$  point DFT and they are periodic with period  $N/4$

$$e_1(k + \frac{N}{4}) = e_1(k), \quad e_2(k + \frac{N}{4}) = e_2(k) \quad 0 \leq k \leq \frac{N}{4}$$

$$e_1 W_{N/2}^{(k+N/4)} = -W_{N/2}^k$$

$$\therefore F_1(k + \frac{N}{4}) = e_1(k) - W_{N/2}^k e_2(k)$$

III by  $f_2(n)$  is split into two sequences  $h_1(n)$  &  $h_2(n)$  consisting of even and odd samples of  $f_2(n)$  respectively.

$$h_1(n) = f_2(2n), \quad h_2(n) = f_2(2n+1) \quad 0 \leq n \leq \frac{N}{4} - 1$$

$$\text{wkt } F_2(k) = \sum_{n=0}^{\frac{N}{2}-1} f_2(n) W_{N/2}^{kn}$$

$$\therefore F_2(k) = \sum_{n(\text{even})} f_2(n) W_{N/2}^{kn} + \sum_{n(\text{odd})} f_2(n) W_{N/2}^{kn} \quad 0 \leq n \leq \frac{N}{2} - 1$$

$$F_2(k) = \sum_{n=0}^{\frac{N}{4}-1} f_2(2n) w_{N/2}^{kn} + \sum_{n=0}^{\frac{N}{4}-1} f_2(2n+1) w_{N/2}^{k(2n+1)}$$

$$= \sum_{n=0}^{\frac{N}{4}-1} h_1(n) w_{N/4}^{kn} + w_{N/2}^k \sum_{m=0}^{\frac{N}{4}-1} h_2(m) w_{N/4}^{km} \quad 0 \leq k \leq \frac{N}{4}-1$$

$$F_2(k) = H_1(k) + w_{N/2}^k H_2(k)$$

$$F_2(k) = H_1(k) + w_{N/2}^k H_2(k)$$

$$F_2(k+\frac{N}{4}) = H_1(k) - w_{N/2}^k H_2(k)$$

$$0 \leq k \leq \frac{N}{4}-1$$

where  $H_1(k) = \sum_{m=0}^{\frac{N}{4}-1} h_1(m) w_{N/4}^{km}$

$$H_2(k) = \sum_{m=0}^{\frac{N}{4}-1} h_2(m) w_{N/4}^{km}$$

$\therefore$  The number of complex multiplications required to complete the  $N$ -point DFT at the end of II decimation is .

$$= 4 \left(\frac{N}{4}\right)^2 + 2\left(\frac{N}{4}\right) + \frac{N}{2}.$$

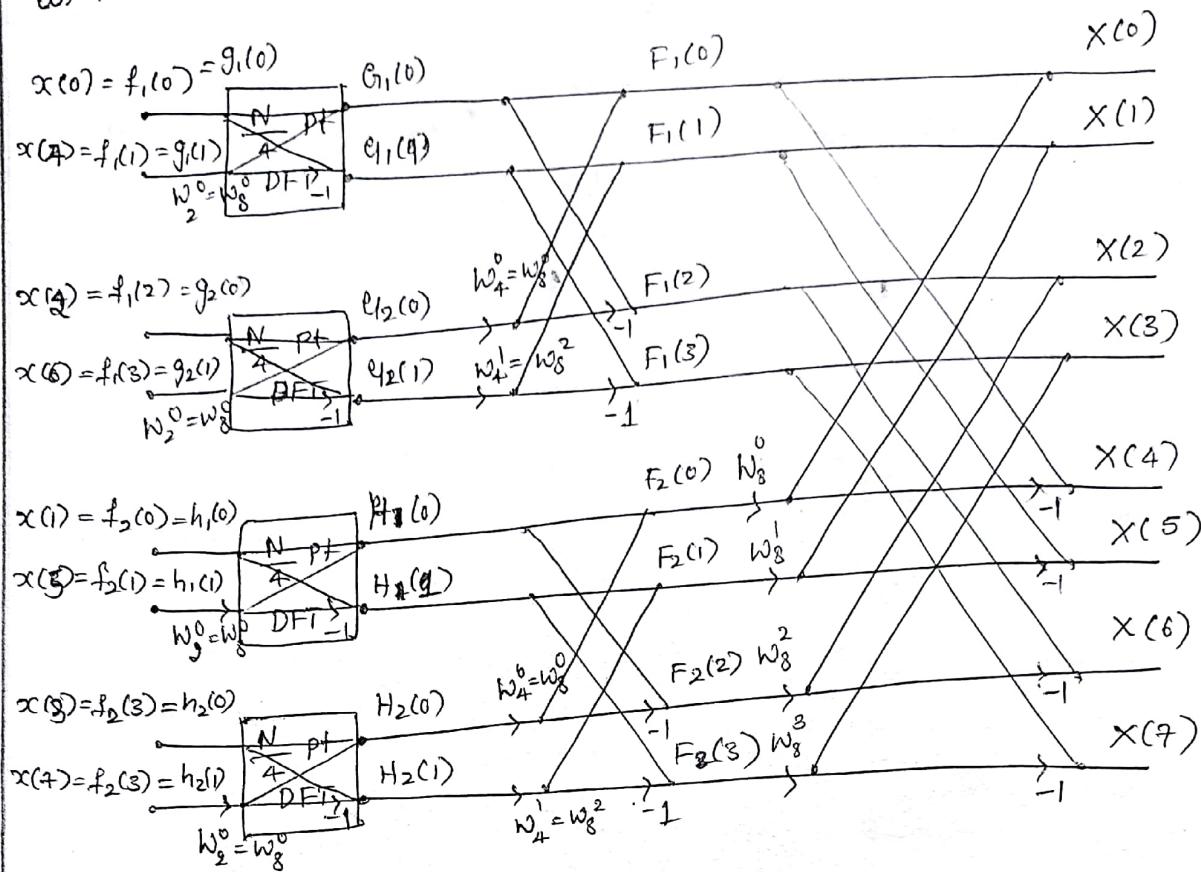

$$\begin{array}{ll} e_1(k), e_2(k) & F_1(k) \\ H_1(k), H_2(k) & F_2(k) \end{array}$$

$$= \underline{\underline{\frac{N^2}{4}}} + N.$$

\* NO. of complex additions required to compute the  $N$ -point DFT at the end of II decimation .

$$= 4 \left[ \frac{N}{4} \left( \frac{N}{4} - 1 \right) \right] + 2 \left[ \frac{N}{2} \right] + N = \underline{\underline{\frac{N^2}{4}}} + N$$

The flow diagram at the end of II decimation for  $N=8$   
is.

\* No of butterfly diagram in each <sup>stage</sup> case =  $N/2$

\* No of Decimations =  $V = \log_2 N$   $\textcircled{B}$  No of stages

\* No of complex Multiplications required to compute the  $N$ -pt

$$\text{DFT} = \frac{N}{2} \cdot V = \frac{N}{2} \times \log_2 N$$

\* No of complex additions required =  $N \cdot V = N \log_2 N$

\* No of multiplication required for direct computation

\* The speed factor =  $\frac{\text{No of Multiplication required for FFT Algorithm}}{\text{No of -- --}}$

$$= \frac{N^2}{\frac{N}{2} \cdot V} = \frac{N^2}{\frac{N}{2} \log_2 N}$$

\* Comparison of computational complexity for the Direct Computation of the DFT Versus the FFT Algorithm.

④ Complete the 4-pt DFT of the sequence  $x(n) = (1, 0, 1, 0)$  using DIT-FFT radix-2 algorithm (8b)

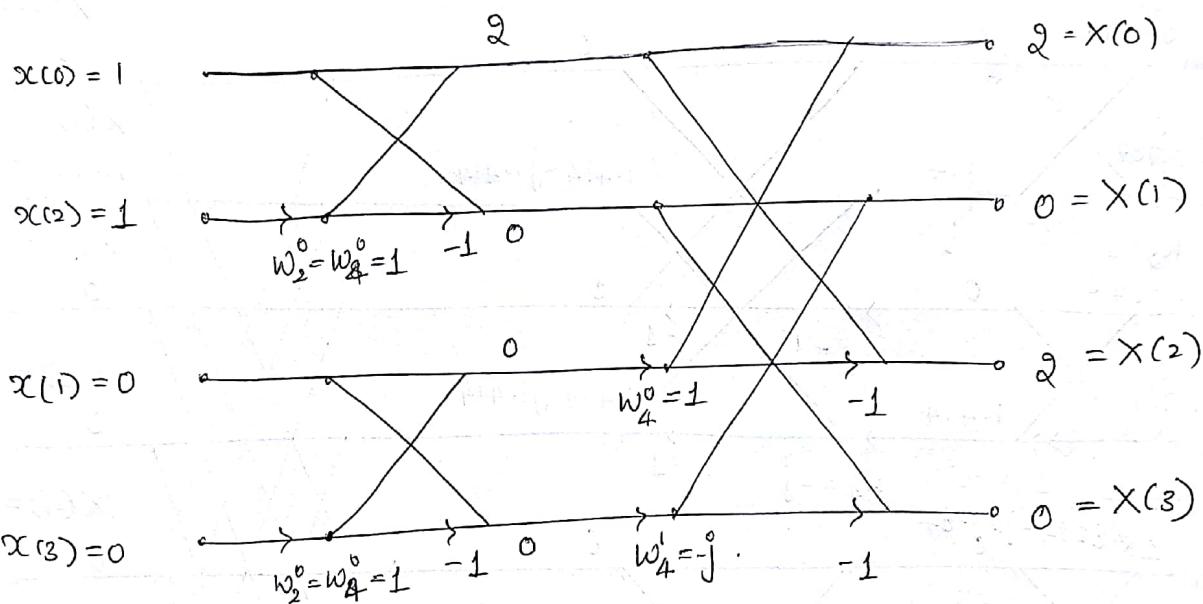

Sol<sup>n</sup>

$$w_4^0 = 1$$

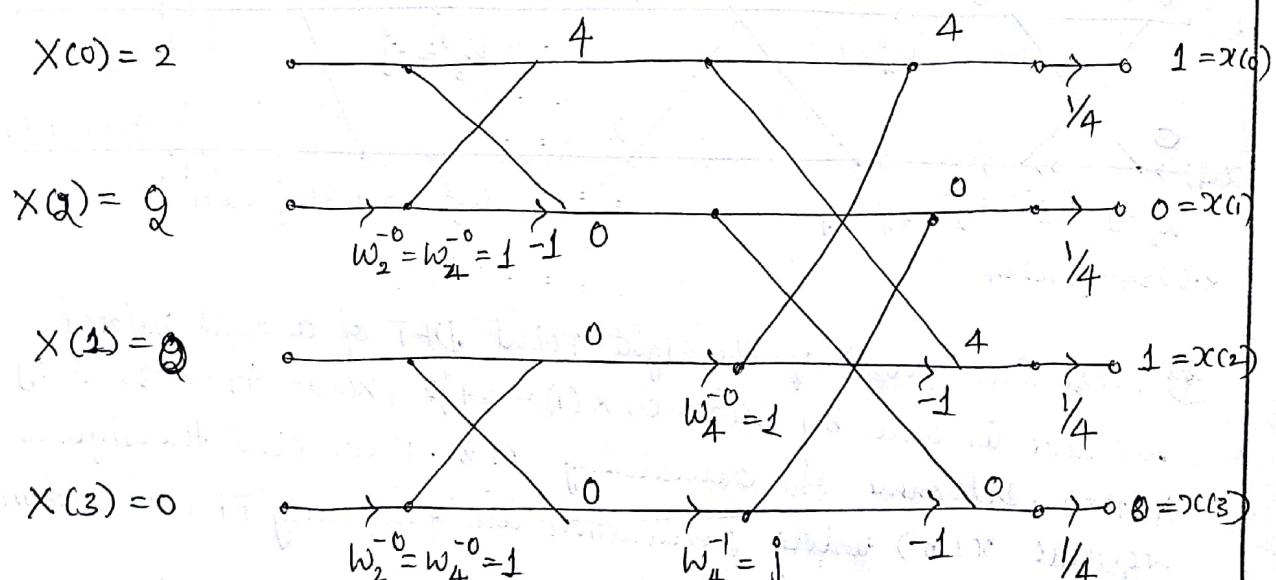

$$w_4^1 = -j$$

$$w_4^{-0} = (w_4^0)^* = 1$$

$$w_4^{-1} = (w_4^1)^* = j$$

$$\text{IDFT} \Rightarrow x(n) = \frac{1}{N} \sum_{k=0}^{N-1} X(k) w_N^{-kn} \quad 0 \leq n \leq N-1$$

## Radix - 2 DIF - FFT Algorithm :

Consider a finite length sequence  $x(n)$  having  $N$ -samples  
 $N = 2^v$  where  $v \rightarrow \text{integer}$ .

\* In this method the frequency spectrum  $X(k)$  is split into smaller and smaller sequences till we get a sequence of length 1.

$$\text{By defn } X(k) = \text{DFT} \{x(n)\}$$

$$= \sum_{n=0}^{N-1} x(n) W_N^{kn} \quad 0 \leq k \leq N-1$$

$\rightarrow$  The time domain sequence  $x(n)$  is split into 2 sequences in the natural order

$$X(k) = \sum_{m=0}^{N/2-1} x(m) W_N^{km} + \sum_{m=N/2}^{N-1} x(m) W_N^{km}$$

$$\begin{aligned} n &= N/2 \\ \frac{N}{2} &= m + N/2 \\ n &= m + N/2 \end{aligned}$$

$$= \sum_{m=0}^{\frac{N}{2}-1} x(m) W_N^{km} + \sum_{m=0}^{\frac{N}{2}-1} x(m + \frac{N}{2}) W_N^{k(m+N/2)}$$

$$\begin{aligned} m + N/2 &= N-1 \\ m &= N-1 - \frac{N}{2} \\ n &= \frac{N}{2}-1 \end{aligned}$$

$$= \sum_{m=0}^{\frac{N}{2}-1} x(m) W_N^{km} + \sum_{m=0}^{\frac{N}{2}-1} x(m + \frac{N}{2}) W_N^{km} W_N^{kN/2}$$

$$\underbrace{W_N^{kN/2}}_{(-1)^k}$$

$$= \sum_{m=0}^{\frac{N}{2}-1} (x(m) + (-1)^k x(m + \frac{N}{2})) W_N^{km} \rightarrow ① \quad 0 \leq k \leq N-1$$

$$\left( \because W_N^{kN/2} = (-1)^k \right)$$

\* Splitting the sequence  $X(k)$  into two sequences  $F_1(k)$  &  $F_2(k)$  of length  $N/2$  consisting of even & odd samples of  $X(k)$  respectively

Even Samples of  $X(k) = x(2k) = F_1(k)$

odd  $\rightarrow$   $= X(2k+1) = F_2(k)$

Sq. ① will be

$$F_1(k) = x(2k) = \sum_{n=0}^{\frac{N}{2}-1} [x(n) + (-1)^{2k} x(n+\frac{N}{2})] w_N^{2kn}$$

$$= \sum_{n=0}^{\frac{N}{2}-1} [x(n) + x(n+\frac{N}{2})] w_{N/2}^{kn}$$

$0 \leq k \leq \frac{N}{2}-1$   
 $\because (-1)^{2k} = 1$   
 $\Sigma N \Rightarrow N/2$   
 $m \Rightarrow N/2$

$$= \sum_{n=0}^{\frac{N}{2}-1} f_1(n) w_{N/2}^{kn}$$

$0 \leq k \leq \frac{N}{2}-1$   
 $m \Rightarrow N/2$

where  $f_1(n) = x(n) + x(n+\frac{N}{2})$

$\therefore F_1(k) = x(2k) = \sum_{n=0}^{\frac{N}{2}-1} f_1(n) w_{N/2}^{kn}$

$0 \leq k \leq \frac{N}{2}-1$   
 $\rightarrow ②$

likewise  $F_2(k) = x(2k+1) = \sum_{n=0}^{\frac{N}{2}-1} [x(n) - x(n+\frac{N}{2})] w_N^{2kn} w_N^n$

$$= \sum_{n=0}^{\frac{N}{2}-1} \{ [x(n) - x(n+\frac{N}{2})] w_N^n \} w_{N/2}^{kn}$$

$F_2(k) = x(2k+1) = \sum_{n=0}^{\frac{N}{2}-1} f_2(n) w_{N/2}^{kn}$

$0 \leq k \leq \frac{N}{2}-1$   
 $\rightarrow ③$

where  $f_2(n) = [x(n) - x(n+\frac{N}{2})] w_N^n$

$0 \leq n \leq \frac{N}{2}-1$

For  $N=8 \Rightarrow f_1(n) = x(n) + x(n+\frac{8}{2})$   
 $f_2(n) = x(n) - x(n+\frac{8}{2}) w_8^n$

$0 \leq n \leq \frac{8}{2}-1$

$$\Rightarrow f_1(n) = x(n) + x(n+4)$$
$$f_2(n) = x(n) - x(n+4) w_8^n$$

$0 \leq n \leq 3$

when  $n=0$ ,  $f_1(0) = x(0) + x(4)$

$$f_2(0) = [x(0) - x(4)] w_8^0$$

$n=1$ ,  $f_1(1) = x(1) + x(5)$

$$f_2(1) = [x(1) - x(5)] w_8^1$$

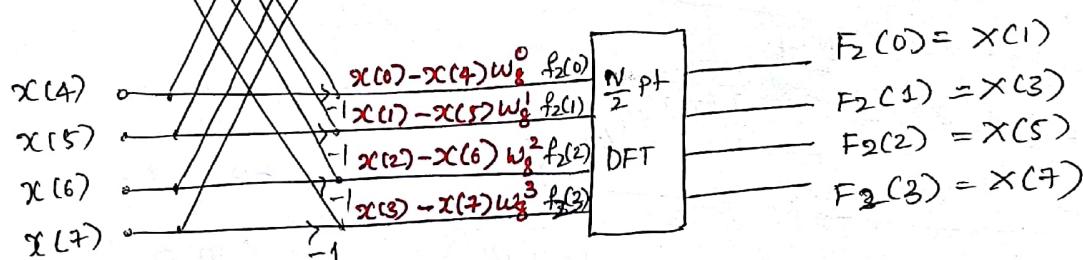

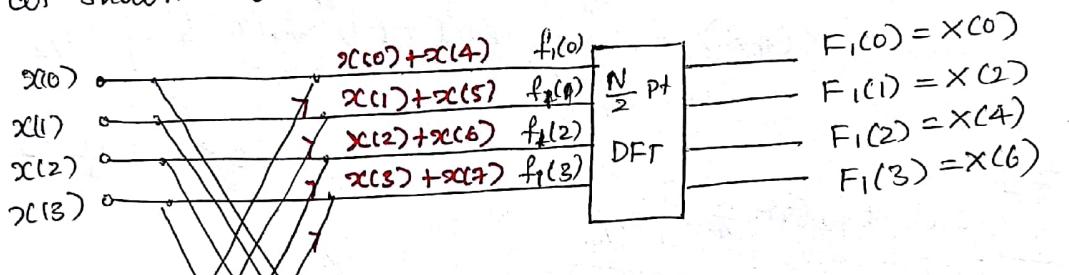

$n=2$ ,  $f_1(2) = x(2) + x(6)$

$$f_2(2) = [x(2) - x(6)] w_8^2$$

$n=3$ ,  $f_1(3) = x(3) + x(7)$

$$f_2(3) = [x(3) - x(7)] w_8^3$$

The flow diagram for  $N=8$ , at the end of 1<sup>st</sup> decimation is as shown below.

$$\text{WKT } F_1(k) = x(2k) = \sum_{n=0}^{\frac{N}{2}-1} f_1(n) w_{N/2}^{kn}, \quad 0 \leq k \leq \frac{N}{2} - 1$$

\* The time domain sequence  $f_1(n)$  is split into two sequences

in the natural order

$$F_1(k) = \sum_{n=0}^{\frac{N}{4}-1} f_1(n) w_{N/2}^{kn} + \sum_{n=N/4}^{\frac{N}{2}-1} f_1(n) w_{N/2}^{kn}$$

$$= \sum_{n=0}^{\frac{N}{4}-1} f_1(n) w_{N/2}^{kn} + \sum_{n=0}^{\frac{N}{4}-1} f_1(n + \frac{N}{4}) w_{N/2}^{k(n+\frac{N}{4})}$$

$$\begin{aligned}
 &= \sum_{n=0}^{\frac{N}{4}-1} f_1(n) w_{N/2}^{kn} + \sum_{n=0}^{\frac{N}{4}-1} f_1\left(n + \frac{N}{4}\right) w_{N/2}^{kn} \\
 &= \sum_{n=0}^{\frac{N}{4}-1} \left[ f_1(n) + (-1)^k f_1\left(n + \frac{N}{4}\right) \right] w_{N/2}^{kn} \quad 0 \leq k \leq \frac{N}{2} - 1
 \end{aligned}$$

→  $F_1(k)$  is split into two sequences  $e_1(k)$  &  $e_2(k)$  each of length  $\frac{N}{4}$  consisting of even and odd samples of  $F_1(k)$  respectively.

$$e_1(k) = \text{even samples of } F_1(k) = F_1(2k) = X(4k)$$

$$e_2(k) = \text{odd samples of } F_1(k) = F_1(2k+1) = X(4k+2)$$

$$e_1(k) = F_1(2k) = X(4k) = \sum_{n=0}^{\frac{N}{4}-1} \left[ f_1(n) + (-1)^{2k} f_1\left(n + \frac{N}{4}\right) \right] w_{N/2}^{2kn} \quad 0 \leq k \leq \frac{N}{4} - 1$$

$$e_1(k) = \sum_{n=0}^{\frac{N}{4}-1} \left[ f_1(n) + f_2\left(n + \frac{N}{4}\right) \right] w_{N/4}^{kn} \quad 0 \leq k \leq \frac{N}{4} - 1$$

$$e_1(k) = X(4k) = \sum_{n=0}^{\frac{N}{4}-1} g_1(n) w_{N/4}^{kn} \quad 0 \leq k \leq \frac{N}{4} - 1$$

$$\text{where } g_1(n) = f_1(n) + f_2\left(n + \frac{N}{4}\right) \quad 0 \leq n \leq \frac{N}{4} - 1$$

DIT-FFT

- The time domain sequence is decimated
- I/P sequence is to be given in bit reversal order
- First calculates 2-pt DFT and combines them
- Suitable for calculating IDFT

DIF-FFT

- The DFT  $X(k)$  is decimated
- The DFT at  $o_k$  is in bit reversed order.
- Decimates the sequence step by step to 2-pt sequence & calculates DFT
- Suitable for calculating DFT
